AT&T Cybersecurity

Formerly

CASE STUDY

End-to-end Functional Testing ensured seamless Web
Experience and flawless form integration with CRM

QAonCloud devised an appropriate QA solution for AT&T Cybersecurity's website, custom API, Salesforce CRM and Marketo integration

The Challenge

Important leads were possibly getting lost due to faulty web forms integration with CRM.

AT&T Cybersecurity uses the SaaS business model to sell products and acquire customers online. The website is central to their marketing and sales effort.

In the absence of a dedicated QA team for their online platforms, our client possibly lost critical leads from a defective integration between web forms, Salesforce CRM and Marketo. Also, bugs were found in their custom-developed APIs, which significantly contributed to the poor user experience. AT&T Cybersecurity wanted dedicated QA resources to pinpoint existing defects, test their websites' ongoing developments, and automate the regression test suites.

Upon careful consideration, AT&T Cybersecurity chose QAonCloud as their dedicated QA partner because of our ability to give high QA expertise in flexible delivery and price models.

"It's always a challenge to find every issue during development and the team at QAonCloud really knows how to help us find problems before our customers can experience them. Your QA services are invaluable to the quality, stability and performance of our services to our customers."

- Robert Johnson
Principal Software Engineer,
AT&T Cybersecurity

ABOUT AT&T CYBERSECURITY

AT&T Cybersecurity is a leading Managed Security Service Provider (MSSP) focused at identifying, preventing and allaying any potential loss caused by cyber attacks. Their services include Cybersecurity Consulting, Network Security, Threat Detection and Endpoint Security.

The Solution

By deeply understanding customer requirements, QAonCloud quickly formulated and executed highly effective test action steps

AT&T Cybersecurity opted for our Fully Managed service delivery model. Our QA architect studied the customer's web and API requirements and devised an appropriate QA solution. We assigned our highly-qualified testers and a dedicated manager to this project.

From 2016, the project has turned into a long term partnership with QAonCloud. To date, we have written 2000+ test cases for 12 modules. A total of 1200+ defects are identified and verified in the successive website improvements over the years; of these, 30% were major bugs. We automated over 70% of the test cases using Selenium. Around 95% of the bugs raised have been accepted, well beyond the SLA of 90%.

Every week, we execute regression suites which we have developed for key features, pages and modules. Our team carry out comprehensive testing on mobile devices to ensure critical modules operate perfectly on these devices. In addition to the test requirements, we help in improving the SEO of the website by finding broken links and improving page speed.

Critical tools used in this project: **Jira, Screaming Frog, Google Analytics, Salesforce and Marketo**

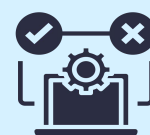

"QAonCloud has helped us bring a higher level of quality to our web properties. Their team is highly capable and skilled, and bring a level of proficiency to the table that allows them to be immediately productive"

- Hasnain Baxamoosa
Sr. Product Manager for Web Technologies
AlienVault

SOLUTION HIGHLIGHTS

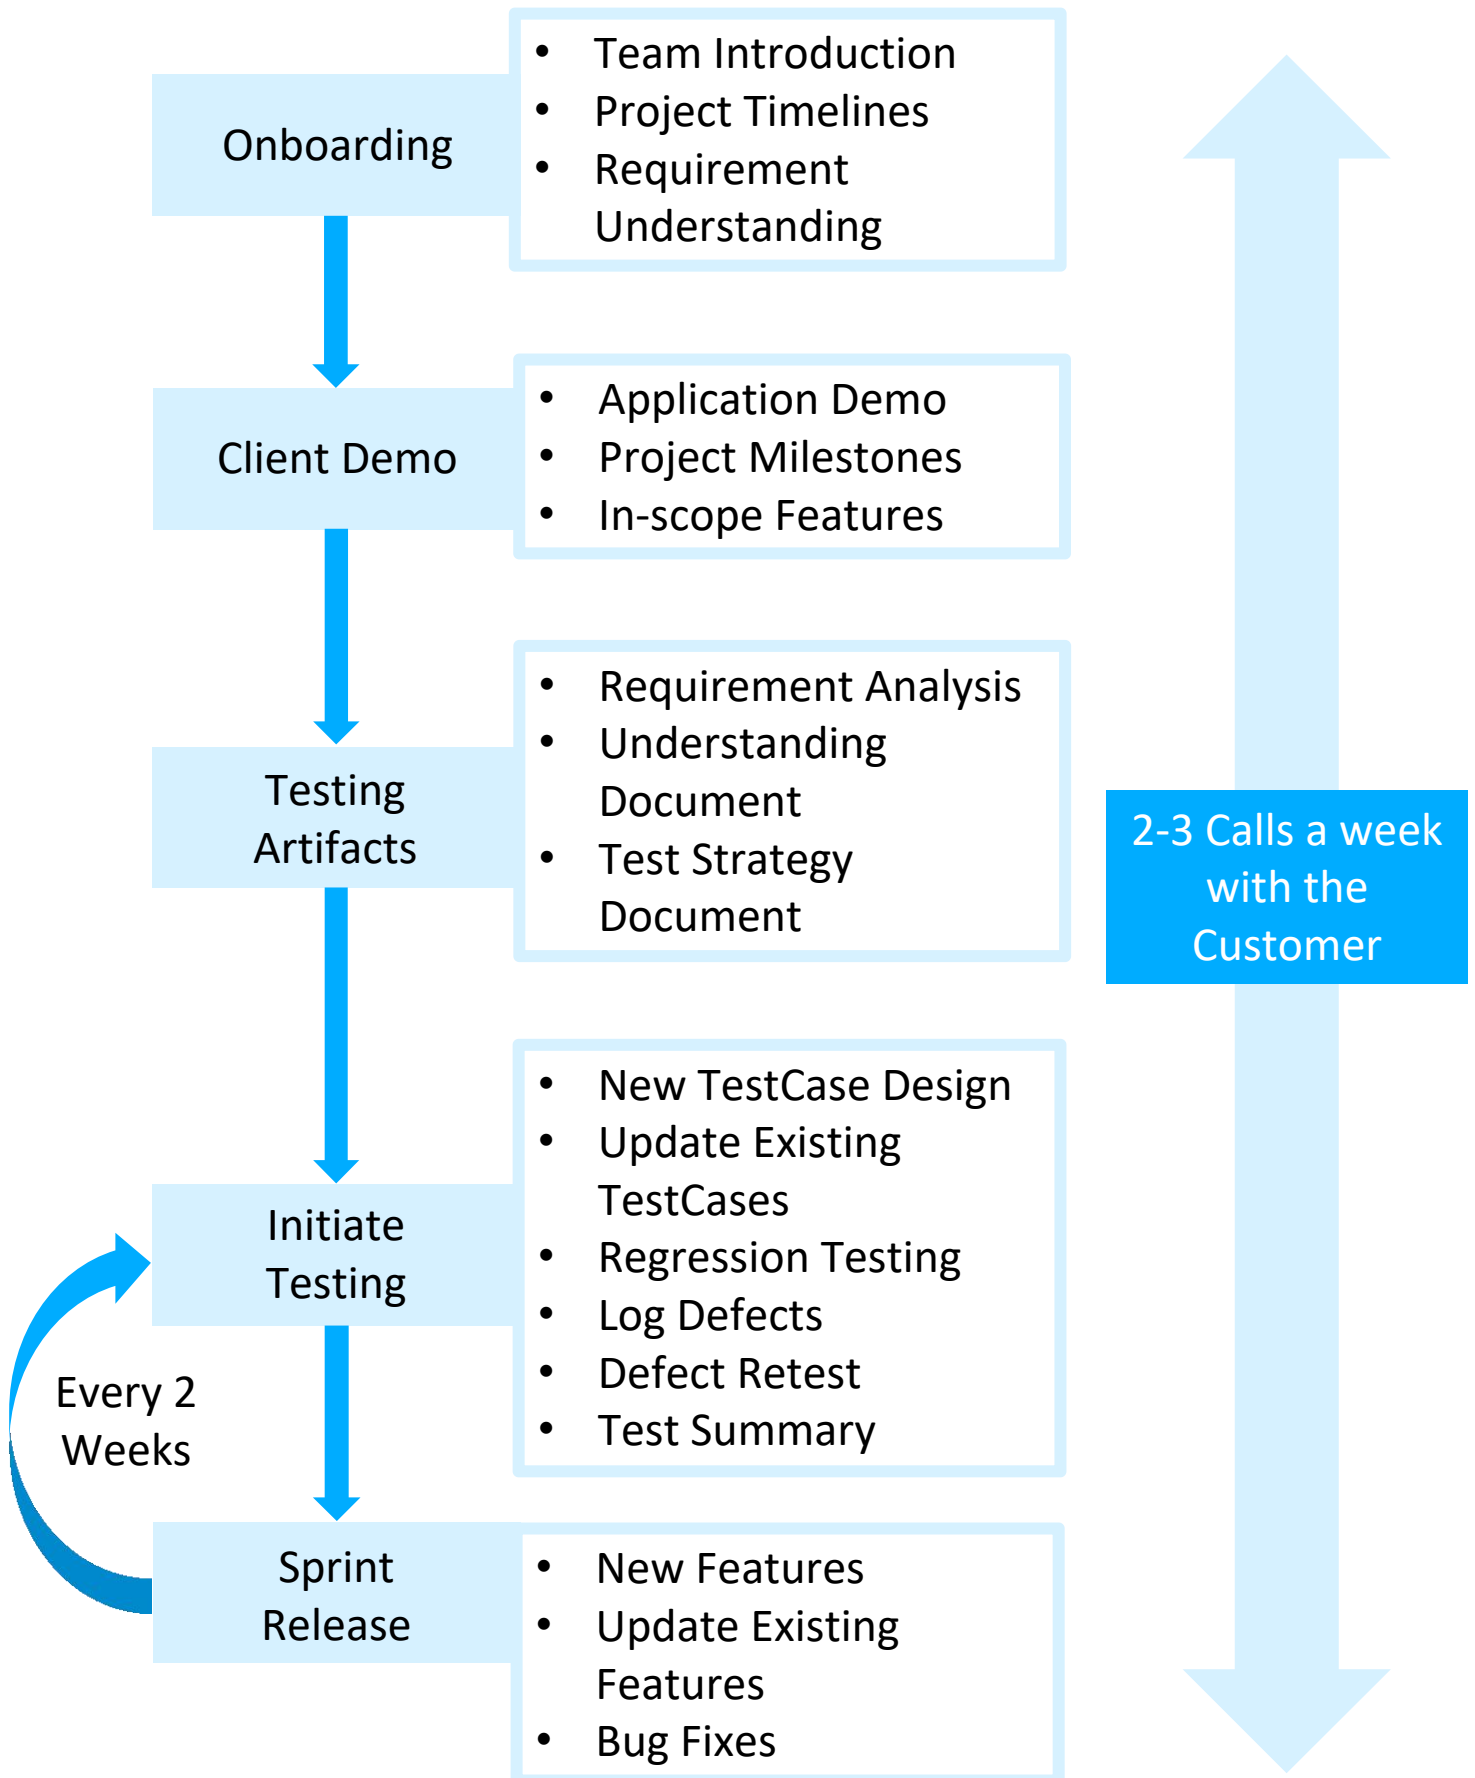

Cross Browser and Mobile testing

Automation and Manual Testing

Our Process

The Result

The enhanced quality and reliability of the website have generated positive feedback from AT&T Cybersecurity's Sales and Marketing teams. Due to our sustained effort, our client's Sales and Marketing teams are no longer concerned about the reliability of web forms and continue to use them as an important source of leads. Our satisfied customer, AT&T Cybersecurity, has an ongoing partnership with us to test new iterative versions of their website.

2000+

Test cases written till date for iterative releases
