company for startups and SMEs

CASE STUDY

End-to-end Functional Testing of loan management
mobile and web application

QAonCloud team performed end-to-end functional testing to facilitate quick and stable releases of client's fintech application

The Challenge

The goal was to enhance the user-friendliness and trustworthiness of the mobile loan app by eliminating defects and performance issues.

Indihood was in search of a QA partner who could do end-to-end QA of all the old and new features of the app and give a QA clear during each development cycle. Since the target audience is first-time mobile fintech users, user-friendliness was of paramount importance to improve adoption and gain customer trust.

Our team had to understand the application's complex workflow and financial terminologies to lead to a successful outcome. We had to ensure the proper functioning of the application on various mobile devices and desktop browsers. As the app was constantly being updated with new features, continuous test plans were needed to be developed to ensure coverage.

Our testers had to lay out all possible user scenarios where the application was susceptible to defects.

"QAonCloud team has worked seamlessly with our solution engineering team in identifying issues with all our implementations. Understanding the complex workflows, App knowledge and timely execution of test cases has helped us in all our releases."

- Leya Sathyan
Program Manager,
Indihood

ABOUT INDIHOOD

Founded by Indian industry stalwarts Ratan Tata, Nandan Nilekani and Vijay Kelkar, Indihood has built its crowd sourcing platform, Avanti Finance, to extend credit and other critical financial products to unserved and underserved households in India.

The Solution

QAonCloud's team quickly comprehended the functional specifications of the product and performed end-to-end testing to ensure a high-quality application is delivered to the end-users.

Our QA architect devised the appropriate QA solution during requirement analysis by studying the customer's functional requirements. We developed a testing strategy that provided broad test coverage to our client's customer-facing mobile application and the supporting web application, used for internal use cases, such as loan approval, loan creation, and partner creation.

We assigned a highly qualified team of QA testers and one delivery manager to this project. Beginning in 2018, the team has now increased to 2X the initial size to serve the growing scope of the project.

We regularly update the test cases, scenarios, and traceability to work products to match the evolving requirements during our engagement. We monitor application performance on Android Studio and sent log files of any latency issues to the engineering team for them to fix.

The client notably appreciated the quick pace of learning financial nuances by the testers.

Our delivery manager constantly communicated with the client's product team, gathered requirements and ensured deliverables via **Hangouts and Google Drive**. The constant communication with the client team and the robust test environment set-up ensured end-to-end test coverage.

For this project, we carried out tests on multiple **android devices** and **sensors**, such as fingerprint scanner. We used **JIRA** to capture requirements and map them to test cases and defects.

Web and Mobile App Testing

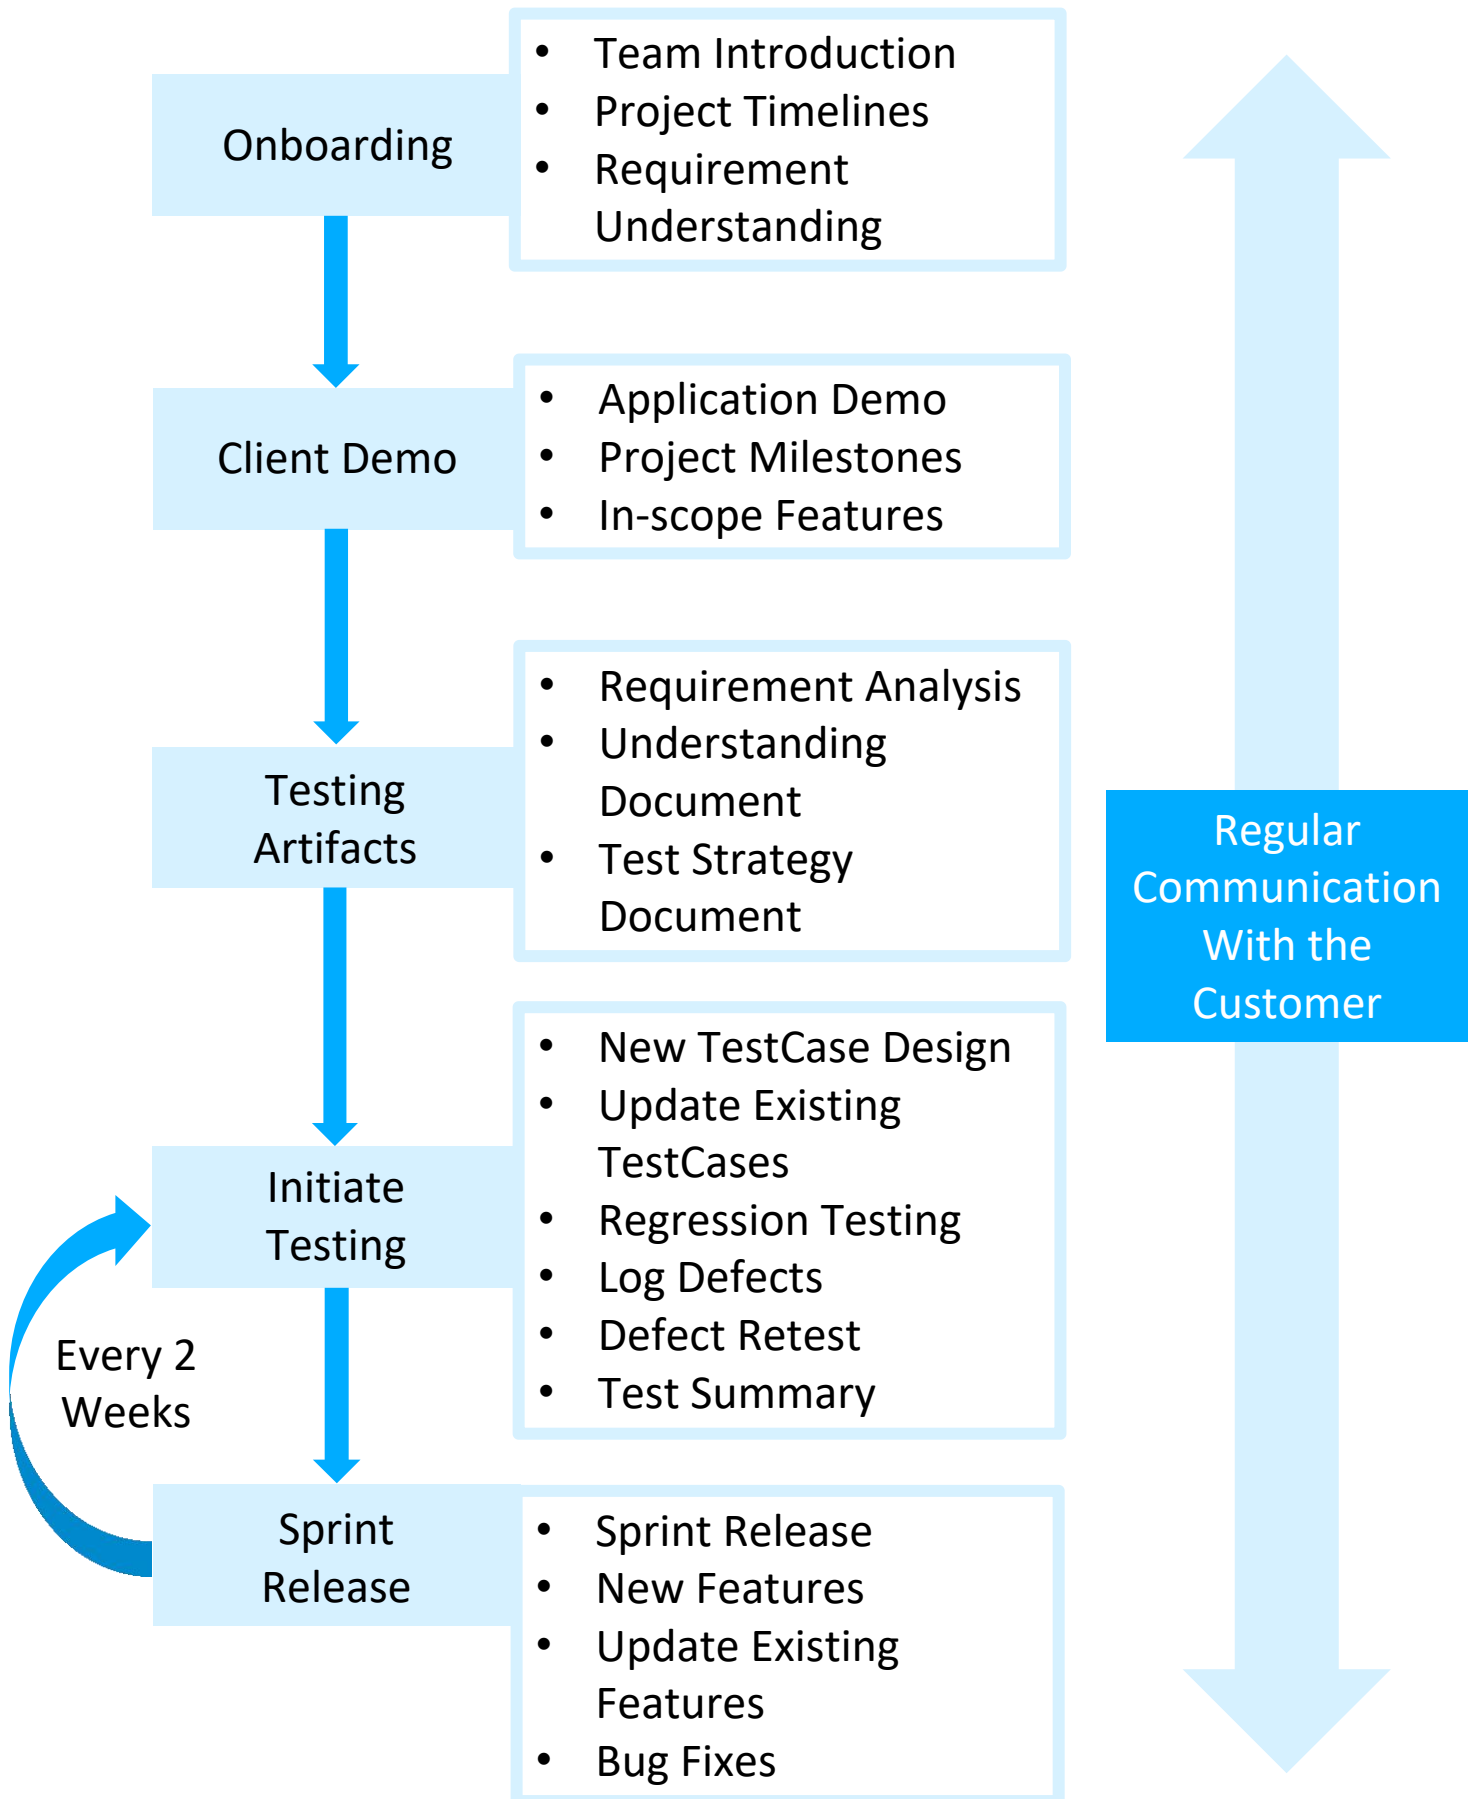

Manual Testing

Notified development team of any persistent latency issues

Our Process

The Result

Facilitated accelerated release of new product features and updates, and the fear of defects no longer holds Indihood back.

Indihood now has the confidence to push ahead with the planned upgrades because of our sustained effort and comprehensive test coverage. As their trusted QA partner, we provide continuous testing as well as end-to-end testing of base models and priority test cases in the event of major feature releases.
