Bring Down App Crashes And Elevate Mobile User Experience With Our Professional Mobile App Testing Service

Bring Down App Crashes and Elevate Mobile User Experience With Our Professional Mobile App Testing Service

September 29, 2022 by Baranidharan R

Reading Time: 3 minutes:

Applications crash when the operating system induces automatic shutdown. Mobile app crashes significantly impact performance and user retention. Apps that crash frequently are uninstalled, often never to be used again. Mobile app testing plays a significant role to bring down app crashes and giving better usability and performance.

According to an analysis by Uninstall.io, 94% of users uninstall mobile apps 30 days after downloading them. Mobile app users find mobile crashes highly disturbing, and 62% of users remove an app after experiencing crashes or issues.

It is important for app developers and testers to focus on app performance optimization for seamless use.

Here are the common reasons behind a mobile app crash.

6 Reasons why mobile apps crash

In a poll conducted by Dimensional Research, respondents stated that they expected mobile apps to launch in four seconds and receive input answers in two seconds, even despite factors like multiple apps running in the background. Here are 6 main reasons testers must focus on to render a smooth, uninterrupted app experience.

Use Cases of Blockchain Tech Across Various Industries

Decentralized security and trust are made possible by technology in several ways. This has led to several industries introducing this modern technology into their processes and operations.

Here are some use cases across various industries.

Banking and Finance

Banking is one sector that could stand to gain the most from incorporating blockchain into its corporate processes. Through this technology, users can make transactions and deposits at any time. Customers can make transactions using blockchain in as little as 10 minutes. Banks can now safely and swiftly transfer money across organizations.

Healthcare

Healthcare providers may use blockchain to safely preserve their patients' medical records. The ability to write a medical record onto the blockchain once we create and sign, assures patients that the alteration of records is not possible. These sensitive encrypted health records contain a secret key so that only authorized people can access them, maintaining their privacy.

Real Estate

We can use Blockchain technology for maintaining and signing property records which can be highly challenging for buyers and sellers today. Blockchain stores property records accurately and permanently in blocks with transparency and a clear description of timelines and ownership. Owing to its framework and operational policies requiring authentication/validation at every stage, it also reduces the possibility of fraudulent transactions.

Supply Chains

Businesses and consumers expect brands to ensure the authenticity of their products, while supply chain actors want improved visibility and responsible sourcing to reduce conflicts. Blockchain-based supply chain solutions assist executives in using data to manage current disruptions and fortify resilience for the future.

One-upside-down visibility can be a constraint for supply chain networks. Smart contracts operate on the Blockchain supply chain solutions, which allows business owners to track and maintain operations and ensure visibility in real-time.

Voting

Blockchain facilitates a contemporary voting system. As demonstrated in the West Virginia midterm elections in November 2018, voting using the technology can end election fraud and increase voter turnout.

Tampering with votes would be next to impossible. Blockchain technology will also uphold electoral openness while lowering the number of people required to carry out an election and giving officials access to results almost immediately. As a result, there would be no need for recounts and no legitimate reason to be concerned that election fraud would occur. Blockchain is also ideal for preventing fake votes and fraudulent voter registration.

Testing Blockchain Applications

Testing a blockchain is essential to ensure that any errors in all ledgers are removed. This eventually shields a company from the drawbacks of a poorly functioning app. Implementing testing enables verification of the many parties the blockchain system depends on for operation and verification that the built ecosystem is operating as intended.

Testing will help lower the risk of introducing error-free new apps and ensure a seamless installation. Testing assures the delivery of high-quality goods and improves consumer experiences.

It is crucial in the case of public blockchain as real money is at stake. A single error in smart contracts might result in significant financial losses.

In a nutshell, testing blockchain apps involves inspection of every aspect of the chain from the ground up. This includes the chain itself and all the associated ledgers.

Challenges of Testing Next-Gen Blockchain Apps & Ways to Overcome

Blockchain testing is irreplaceable and lacks technical, functional, and legal competence. It encounters many problems due to developers' weak conceptualisation, standardization, and abstraction skills.
