

About QAonCloud:

QAonCloud is a leading Software Testing services company, based in Chennai, India. Founded in 2016, QAonCloud's team specializes in providing Manual and Automated testing solutions to customers across the globe. Our prime objective is to deliver high-quality testing solutions to our clients by adopting advanced testing methodologies and tools at optimal costs. Over the last few years, QAonCloud has helped many enterprises ranging from startups to MNCs, to release high-quality applications at an accelerated time to market.

About the Job:

We are looking for a high-performing software product manager to help us to create an AI/ML based platform.

- Work with the market research and management teams to work on the discovery phase.
- Collaborate with the different teams to develop a product vision for the new product.
- Analyze the complete competitive landscape to see what competitors are doing in the market.
- Figure out the strengths and weaknesses of the competitors and use them to make a great product.
- Analyze trend reports, industry content, market statistics, sales data, user stories, mockups, and metrics to come up with a working strategy.
- Translating business goals into specific software requirements
- Prioritizing software features based on market need analyses and company strategies
- Managing software project scope by making tradeoffs between competing software requirements, such as time vs. cost and software security vs. speed
- Oversee and manage the software development lifecycle.
- Prioritizing feature requests from software development teams
- Crystallizing the product vision and working closely with software engineers/the technical team to define its specifications
- Ensuring that the software solution is successfully meeting business goals and users' needs
- Tracking progress against plan and resolving any variances as soon as they are identified
- Making tradeoffs between features, schedule, and costs based on their relationship to business goals, company policies, software architecture constraints, and software development team capabilities
- Manage the development process and the team members to ensure a quick and efficient product launch.
- Develop a complete product requirements document and as well as templates for reference.
- Work on the prioritization of new features based on usability, functionality, and user experience.
- Help figure out a proper pricing model based on what other tech companies and startups are charging for similar software.
- Maintain a complete backlog of all the activities, processes, and workflows of all the relevant teams, stakeholders, and any external influencers and consultants.

Experience and skill:

- A bachelor's degree in software development, computer science, or product management, or a related field. A master's degree is preferred.
- Proven work experience as a product manager, software developer, or project manager is required.
- 7+ years of total work experience; at least 3 years as Product manager

- Certifications from reputable institutions and associations in product management or software-related fields help.
- Extensive knowledge of various product functions, the software development process, and product management.
- The software product manager should be able to work with an agile methodology.
- Should be familiar with critical product concepts such as the MVP (Minimum Viable Product).
- Able to manage and participate in the Daily Scrum and Sprint Planning.
- A deep understanding of the product vision, product launch, and other concepts is required.
- Excellent communication skills for effective stakeholder communication. That includes working with cross-functional teams and managing all of them simultaneously.
- Have great interpersonal, problem-solving, analytical, and research skills.
- Able to develop status reports for external and executive stakeholders.
- Experience with Agile software development methodology, including user story creation
- Experience working with functional and nonfunctional requirements for software development and/or integration projects
- Exceptional presentation, listening, written and verbal communication skills
- Experience of collaborating with different teams.
- Knowledge of AI ML, ComputerVision, NLP, Python preferable
