CASE STUDY

Quality Assurance of a fast growing peer-to-peer
e-commerce platform

Tokopedia had a requirement for a scalable and efficient QA partner that can enable fast-paced and frequent releases needed to provision accelerated growth of their e-commerce platform

The Challenge

Tokopedia aimed to improve the quality of its digital applications to identify bugs earlier in the development process to gain customer trust and confidence, leading to faster adoption

The client had a significant consumer and retailer base across Indonesia. The primary challenge was to ensure adequate test coverage across the buyer and seller portals on both mobile and web applications.

The multitude of user profiles and unique environments presented a challenge for the Tokopedia team. They needed to cover a wide range of devices/platform combinations, two different user types (buyer and seller), and several customized modules that Tokopedia provides.

In the e-commerce industry, a smooth user experience can be the difference between a sale or a drop-off. To thoroughly test their applications under various combinations, Tokopedia looked for a capable third-party QA vendor to augment their specific testing needs.

"QAonCloud has helped us detect app crashes which were affecting our downloads significantly. They have now taken the responsibility of giving a QA clear to all our development sprints. We would like to expand the team further."

- Gautam Chakravarthy,
Engineering Manager,
Tokopedia

ABOUT TOKOPEDIA

Tokopedia is a pioneer in e-commerce technological solution based in Indonesia. Their mission is to democratize commerce and empower small medium enterprises through technology. At present, the platform has 100+ million Monthly Active Users (MAUs) and 11+ million merchants signed up.

The Solution

Together with QAonCloud's dedicated QA team, we implemented an effective testing strategy that enhanced speed, reliability and test coverage, thus reducing the number of bugs and crashes in production.

Tokopedia turned to QAonCloud to make sure the application was ready for millions of customers across Indonesia. QAonCloud's assigned QA Architect quickly devised a solution after understanding customer requirements, and our Delivery manager led the charge. Within a few days, we put together a team of testers for each of Tokopedia's buyer and seller portals across device platforms- Android and Web. Our team seamlessly fitted into the pre-existing development process and aided faster release cycles.

APIs communicating between modules and payment systems were not stable. Focus on API HTTP requests under different network connections (2G and 3G) was given, and defects were identified using **Charles Proxy** to the point where it was reliable enough.

App developers have crash reporting tools at hand, but finding and reproducing those crashers can be tricky. Plus, all the bugs do not appear as crashes, impeding the user experience. QAonCloud brought visibility to these issues using **Crashlytics**.

Phabricator and **JIRA** were used to capture requirements and map them to test cases and defects.

Our team had constant communication with the client on the **Slack** messaging app.

SOLUTION HIGHLIGHTS

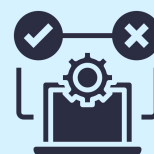

Cross Browser and Mobile testing

Functional Testing

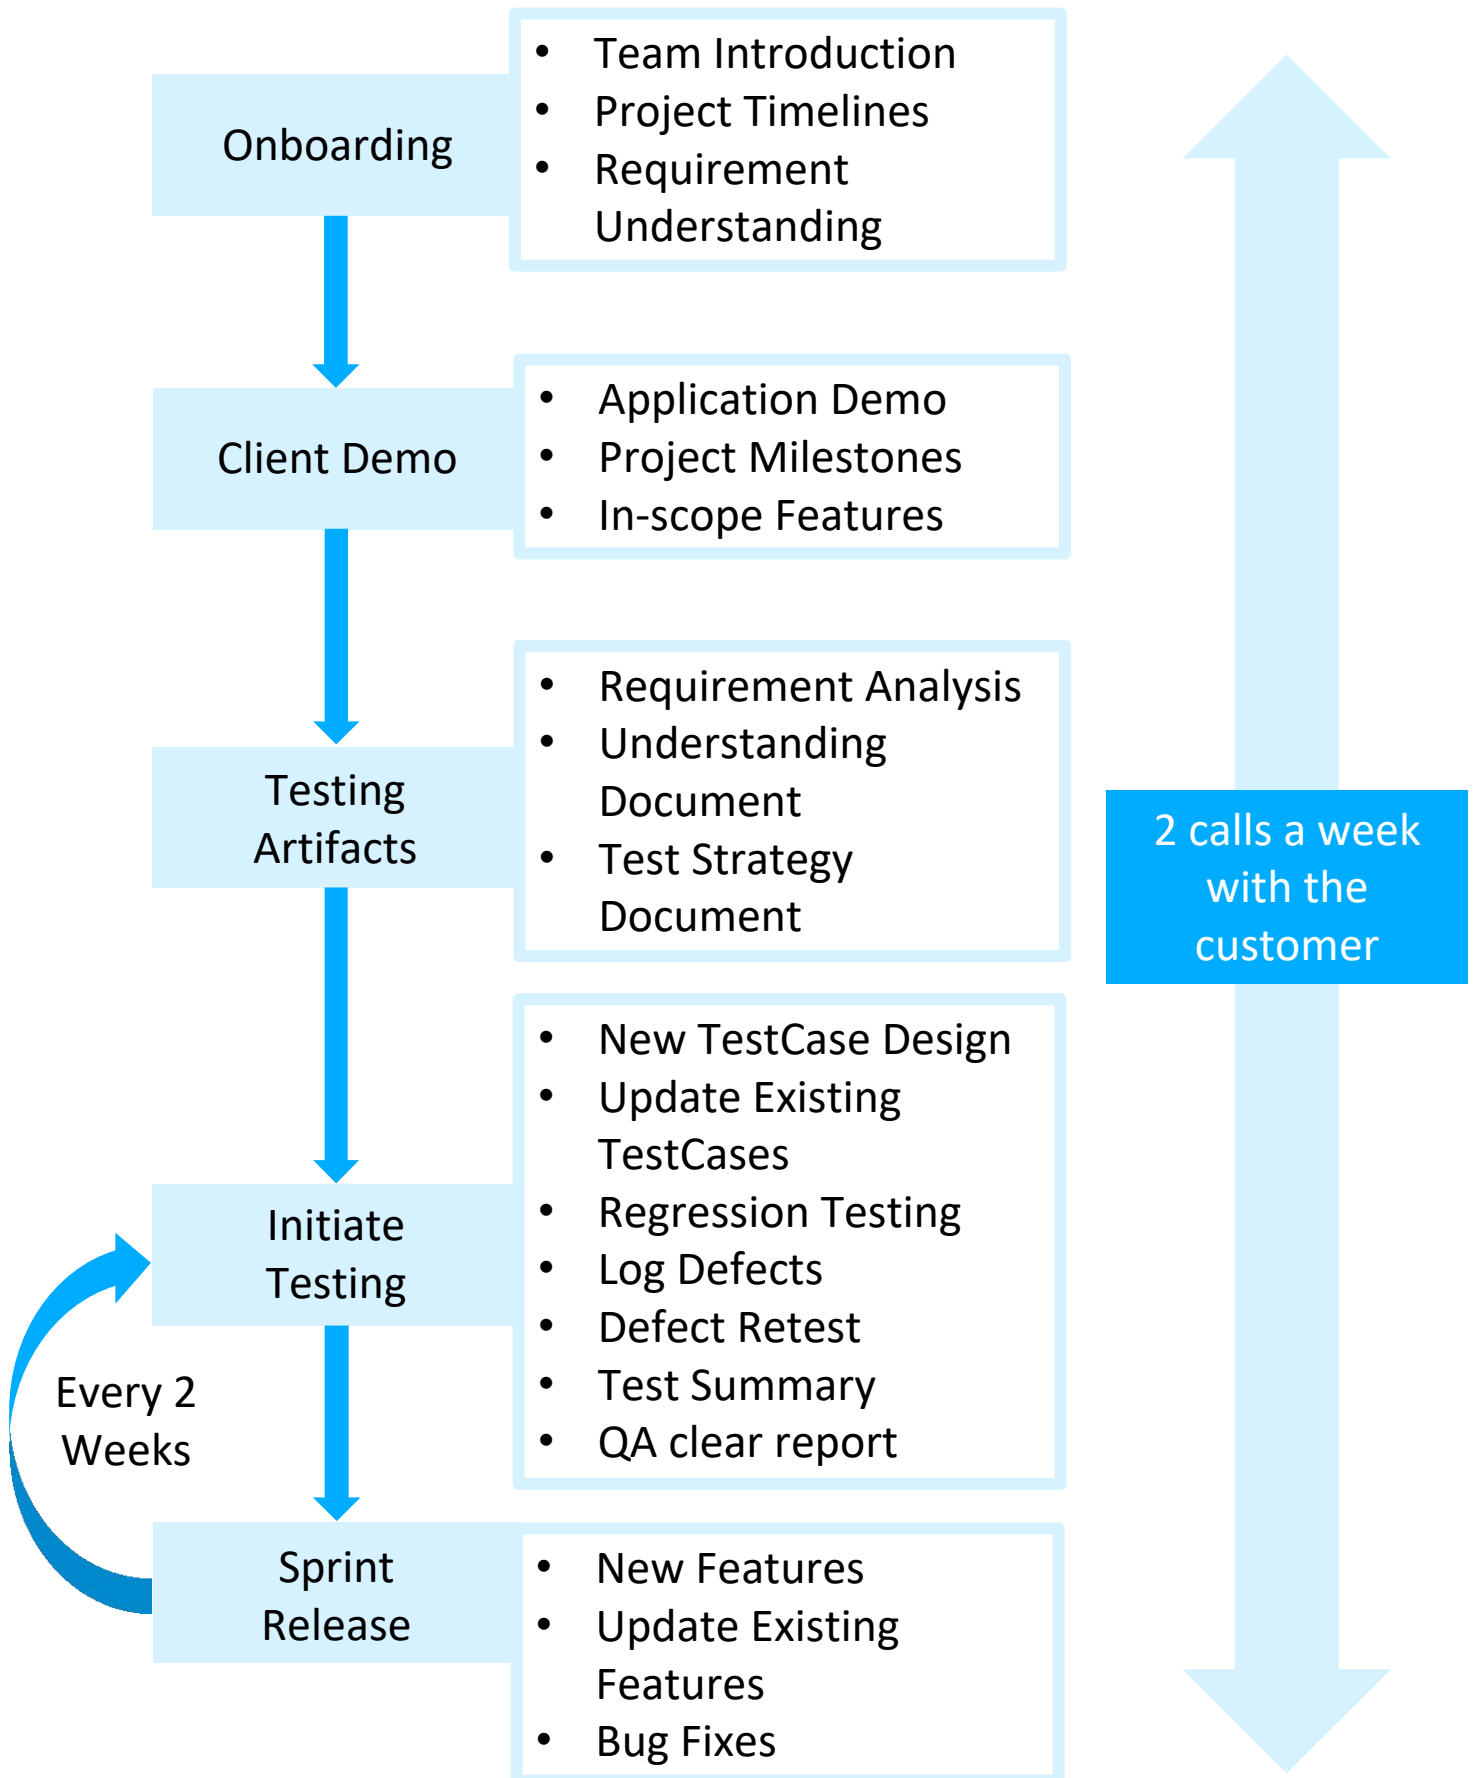

CrashTesting

Testing HTTP Requests under different network conditions

Our Process

The Result

By collaborating with QAonCloud, Tokopedia has dramatically improved the app user experience. The results were reflected by showing significant improvement of the App Store ratings.

Over 20 months period, QAonCloud has identified thousands of bugs and crashes for Tokopedia over various release cycles. Our team identified all production bugs within the first QA clear. Thanks to our collaboration, Tokopedia was able to provide a convenient and truly user-centric online shopping experience.
